

Lecture

"From the cell to cancer : An evolutionary perspective of development and cancer."

Tuesday March 11th 2014

At 6 :00 pm

Amphitheater SIMONE WEIL
5 allée Jacques Berque, Nantes

By

Ana SOTO
and
Carlos
SONNENSCHNEIN

Professors of Integrative
Physiology and Pathobiology
at Tufts University School of
Medicine (USA)

«Explanations of carcinogenesis have been debated for over a century. We will briefly make a historic and an epistemologic overview of the subject with special emphasis on the quality and relevance of the premises adopted by those favoring either a) the somatic mutation theory (SMT) and its variants or b) the tissue organization field theory (TOFT). These theories differ on two main points: first, while the SMT considers that cancer occurs at the cellular and molecular levels of biological organization, the TOFT is centered at the tissue level of this same hierarchical organization. And second, while the SMT adopts the premise that quiescence is the default state of cells in metazoans, the TOFT adopts, instead, the premise that proliferation is the default state of all cells. Influenced by a reductionist narrative, the SMT considers cancer a molecular, genetic disease. In contrast, the TOFT adopts an organicist approach and proposes that cancer is an example of how development may go awry. Experimental evidence buttressing interpretations that considers cancer as part of a repertory of behaviors inherent to multi-cellular organisms will be evaluated and an attempt will be made to explain how cancer fits into life at large.»
